Documentation Index

This is the table of contents for the TrustLens FYP documentation package. Start with `00-Handover.md` if you haven't already — it's the one file meant to be read in full before anything else.

1. What each document answers

Document	Answers the question
00-Handover.md	What's in this package, and what do I still need to do before submitting?
01-Simple-Guide.md	What is TrustLens, in plain language, and what will the viva panel ask?
02-Index.md	This document — where do I find X?
03-SRS.md	What must the system do? (IEEE 830)
04-SDD.md	How is the system built? (IEEE 1016)
05-Test-Cases.md	What was actually tested, and what's the real defect log? (IEEE 829)
06-User-Manual.md	How does an end user actually use the finished product?
07-Thesis.md	The full submission manuscript — front matter, 8 chapters, references, appendices

2. Generated artefacts — which one to actually submit

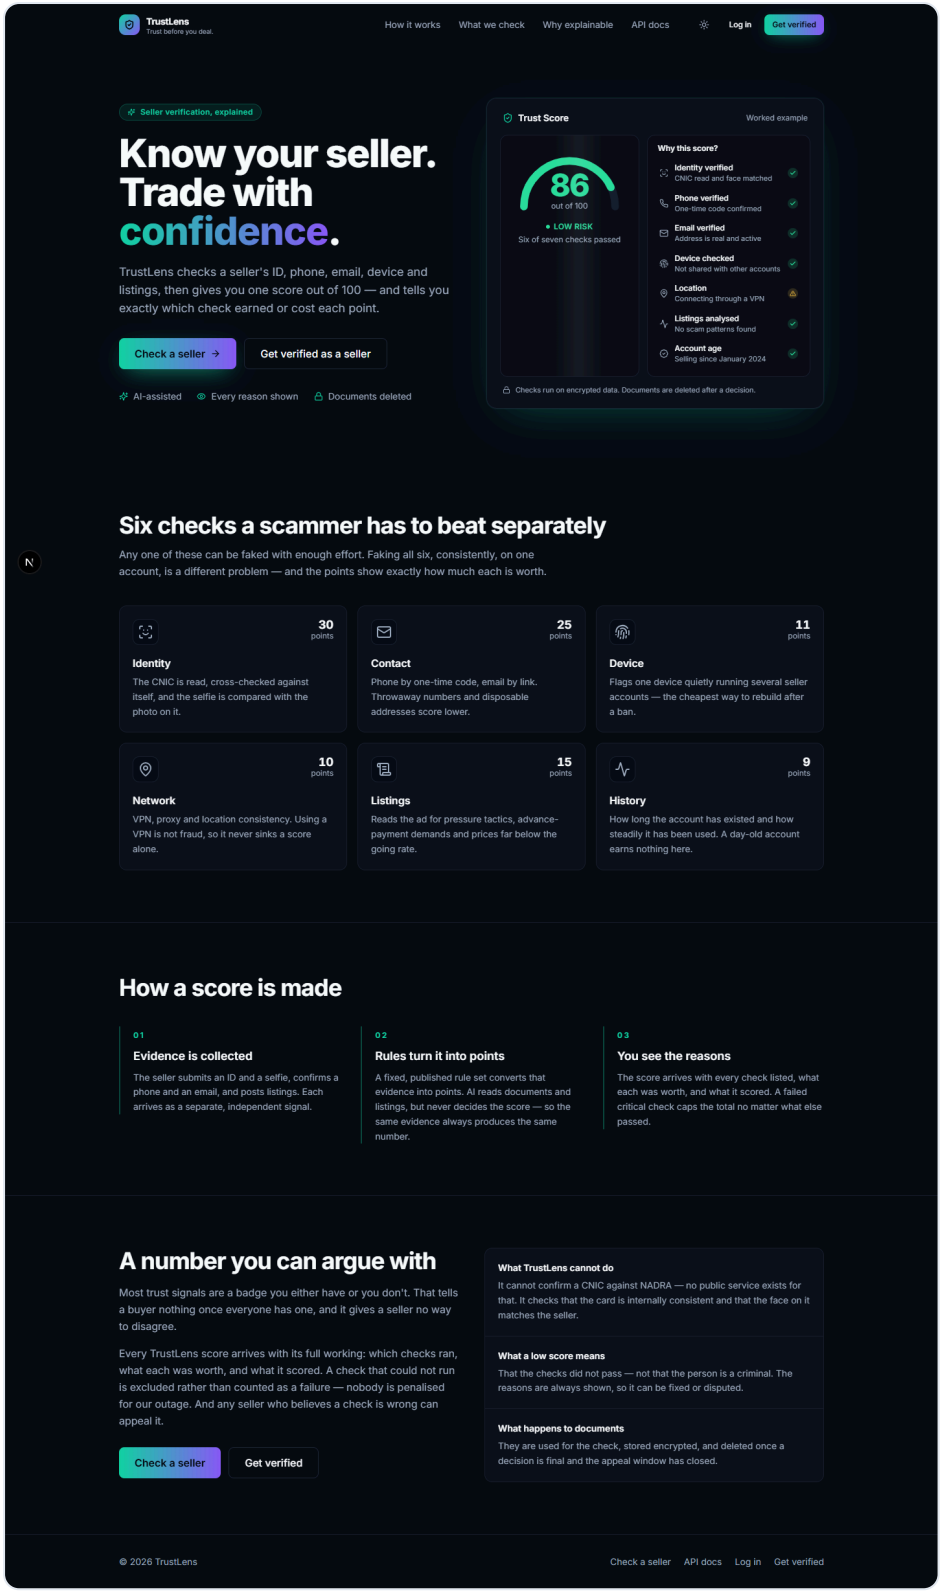

Artefact	What it's for	Is this the submission copy?
`pdf/*.pdf`	Page-numbered PDFs of every document above, generated from the HTML build	Convenience copies for reading/printing/email — **not** the thesis submission copy
`*.html` (via `build_html.py`)	Browser-viewable editions with diagrams inlined as SVG	For reading only
`screenshots/*.png`	The real captured screenshots referenced throughout	Source assets, embedded into the Markdown/HTML/PDF/DOCX
`diagrams/*.png`	Every Mermaid diagram, pre-rendered to print-quality PNG	Used inside the Word thesis, where live Mermaid can't render
`Project_Thesis.docx`	The bound Word document — A4, Times New Roman, 1.5 spacing, binding margin, roman-then-arabic pagination, auto-updating Table of Contents field	**Yes — this is the actual submission copy**, after you update its Table of Contents field in Word (press F9)

If in doubt: the file with `.docx` in its name, after you've opened it in Word and updated the Table of Contents, is what gets submitted. Everything else is a reading aid.

3. Screenshot gallery

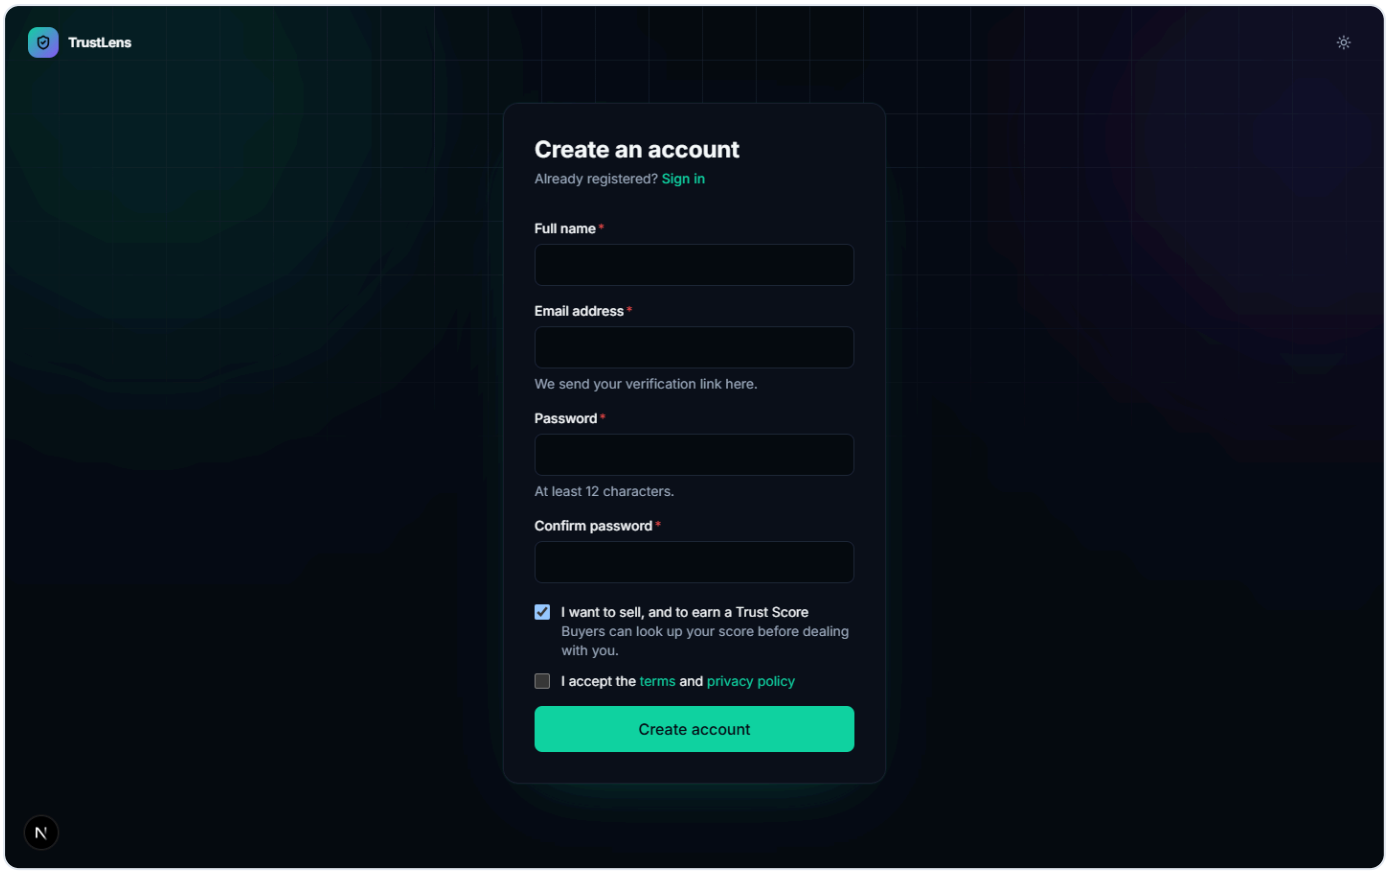

Real screenshots captured from the running local application, grouped by area — unretouched, including the small red "N · 1 Issue" badge visible in a couple of them, which is Next.js's own development-mode indicator and not part of the product's actual interface (it does not appear in a production build). Full-size originals are in `screenshots/` ; the same images are embedded with captions in `06-User-Manual.md` and `07-Thesis.md` §7.1.

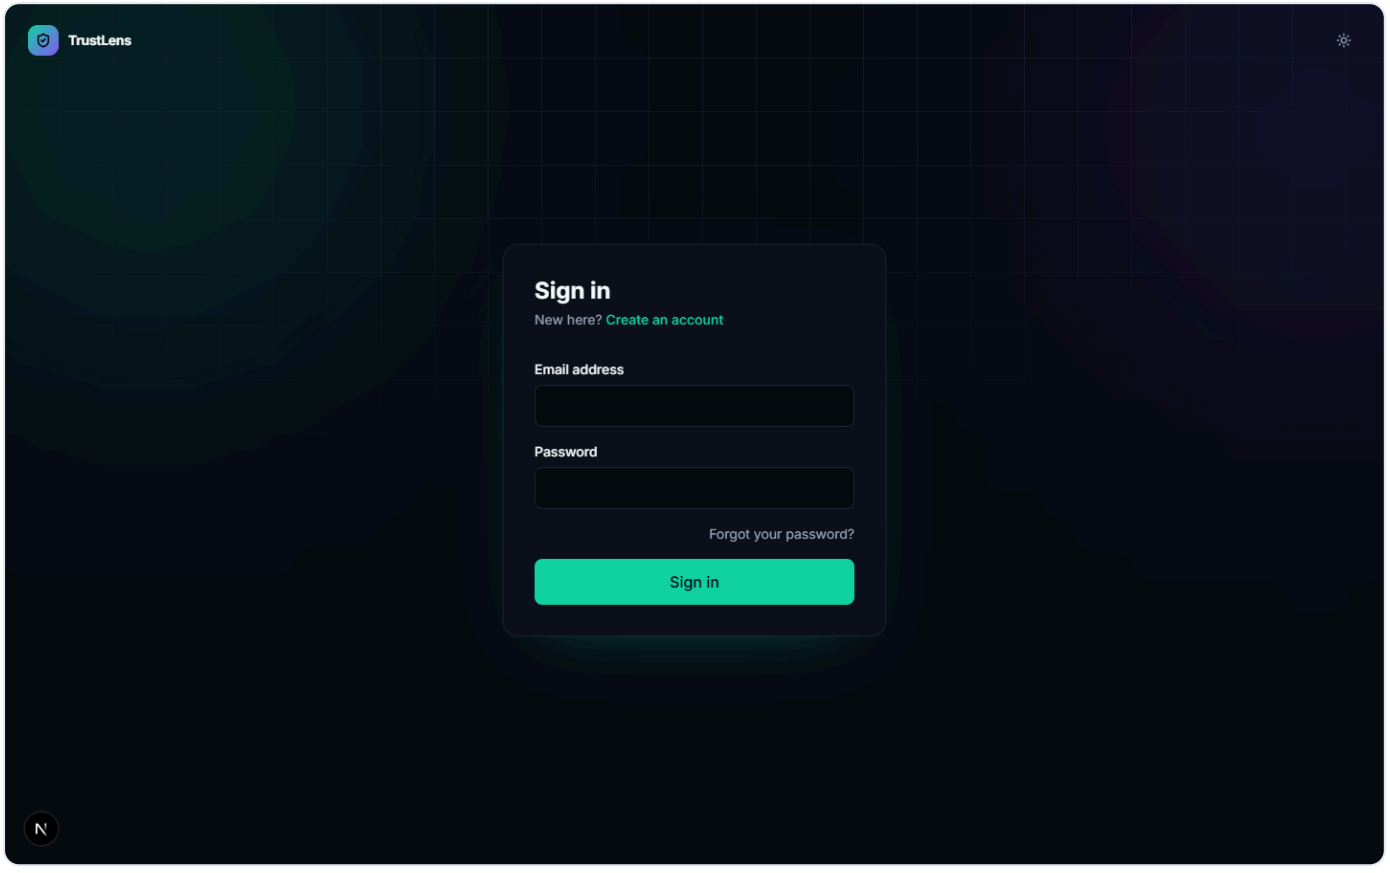

Public / marketing

The landing page — a worked example of a Trust Score breakdown is shown before a visitor even registers, stating the product's core claim directly.

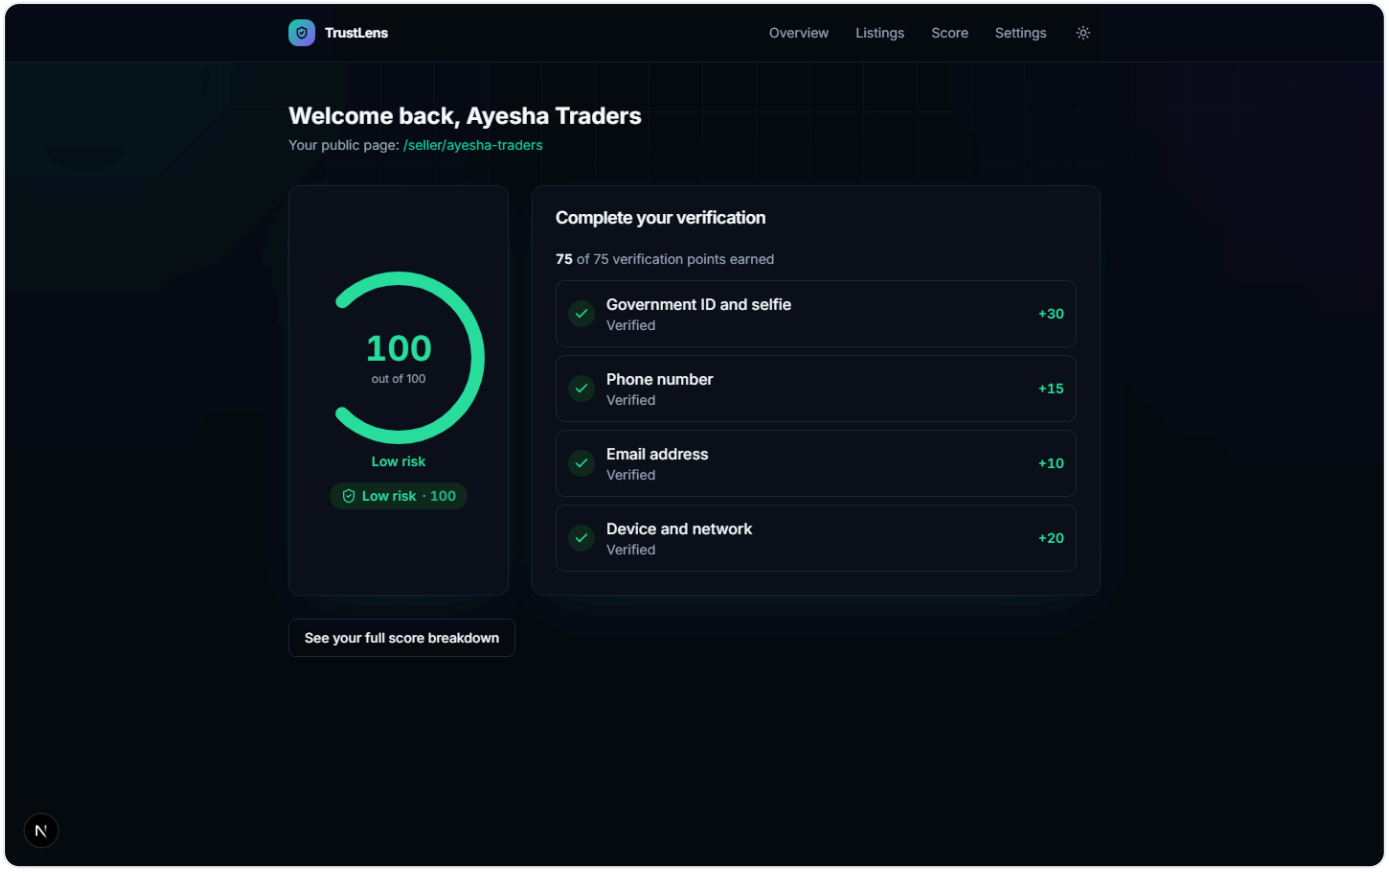

Account creation and sign-in

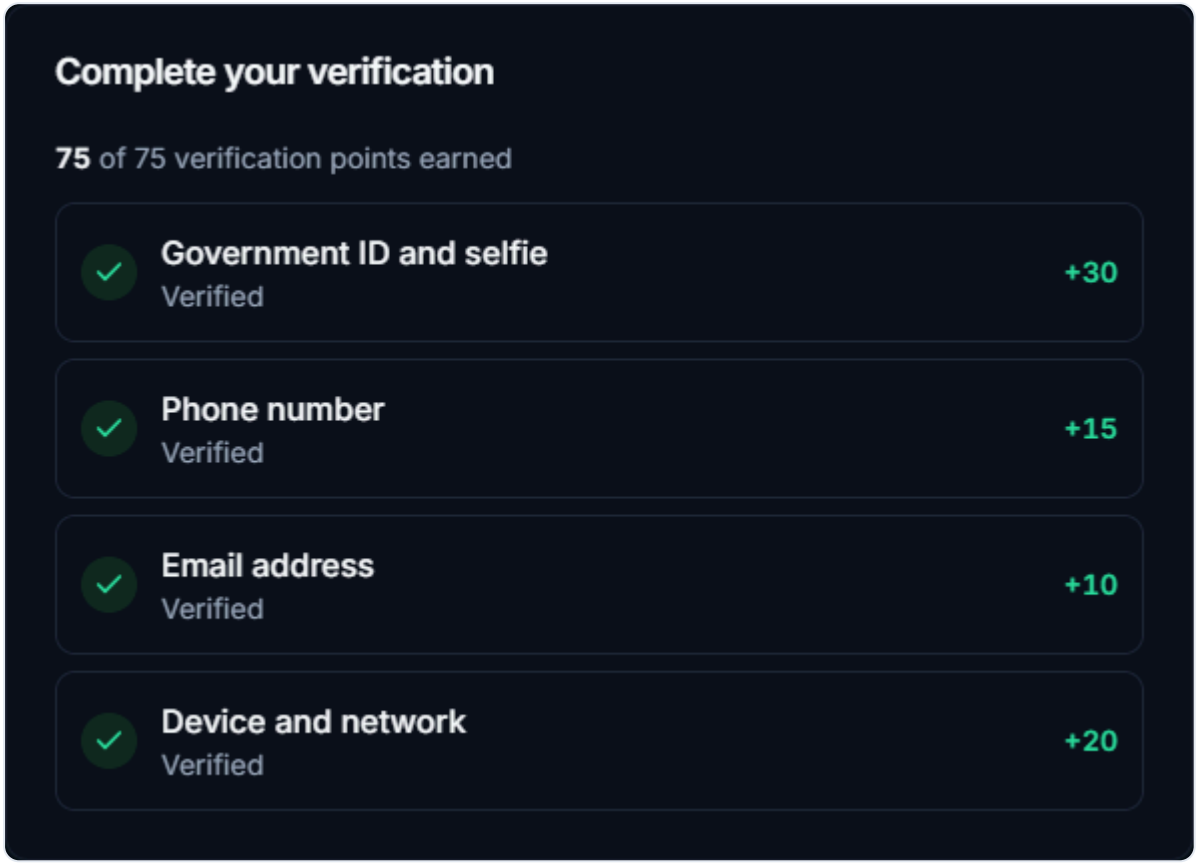

Registration and sign-in — minimal fields, the password policy stated inline, and an explicit seller/buyer choice at signup.

The seller journey

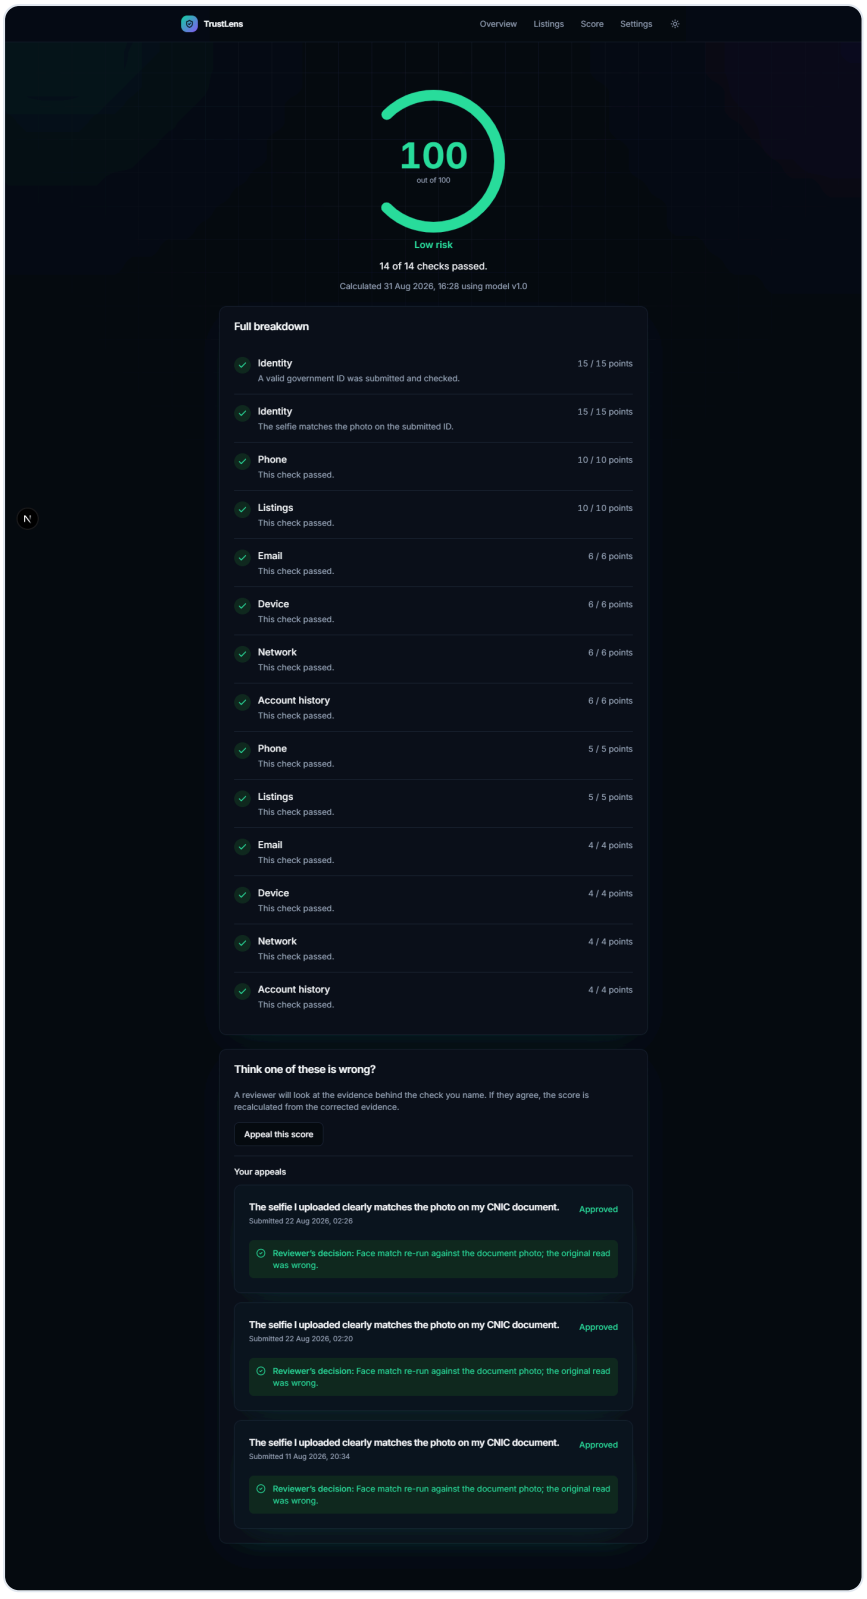

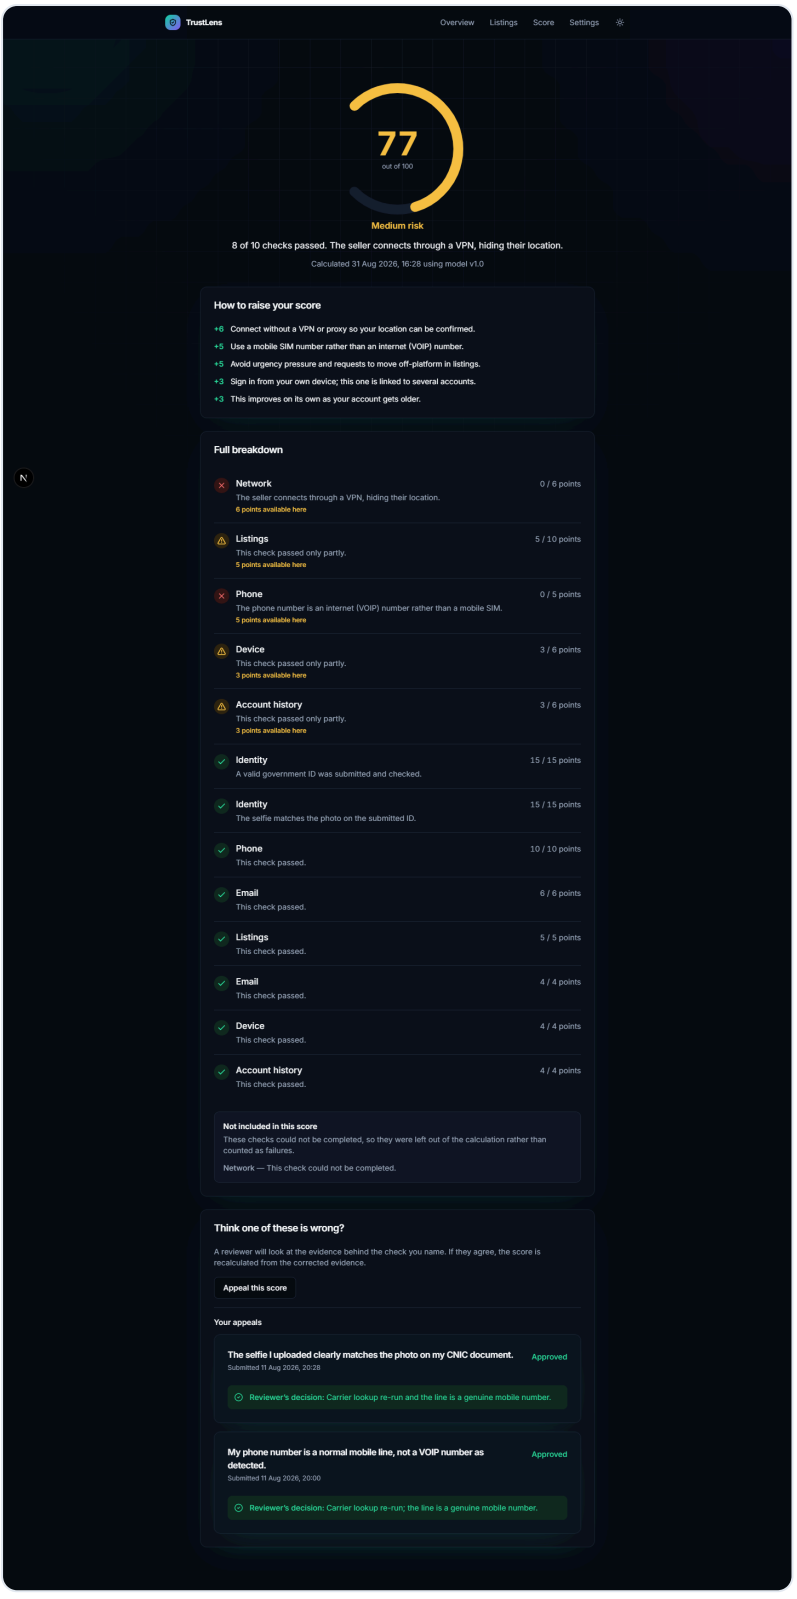

A signed-in seller's overview — the entry point to verification, listings, and the Trust Score.

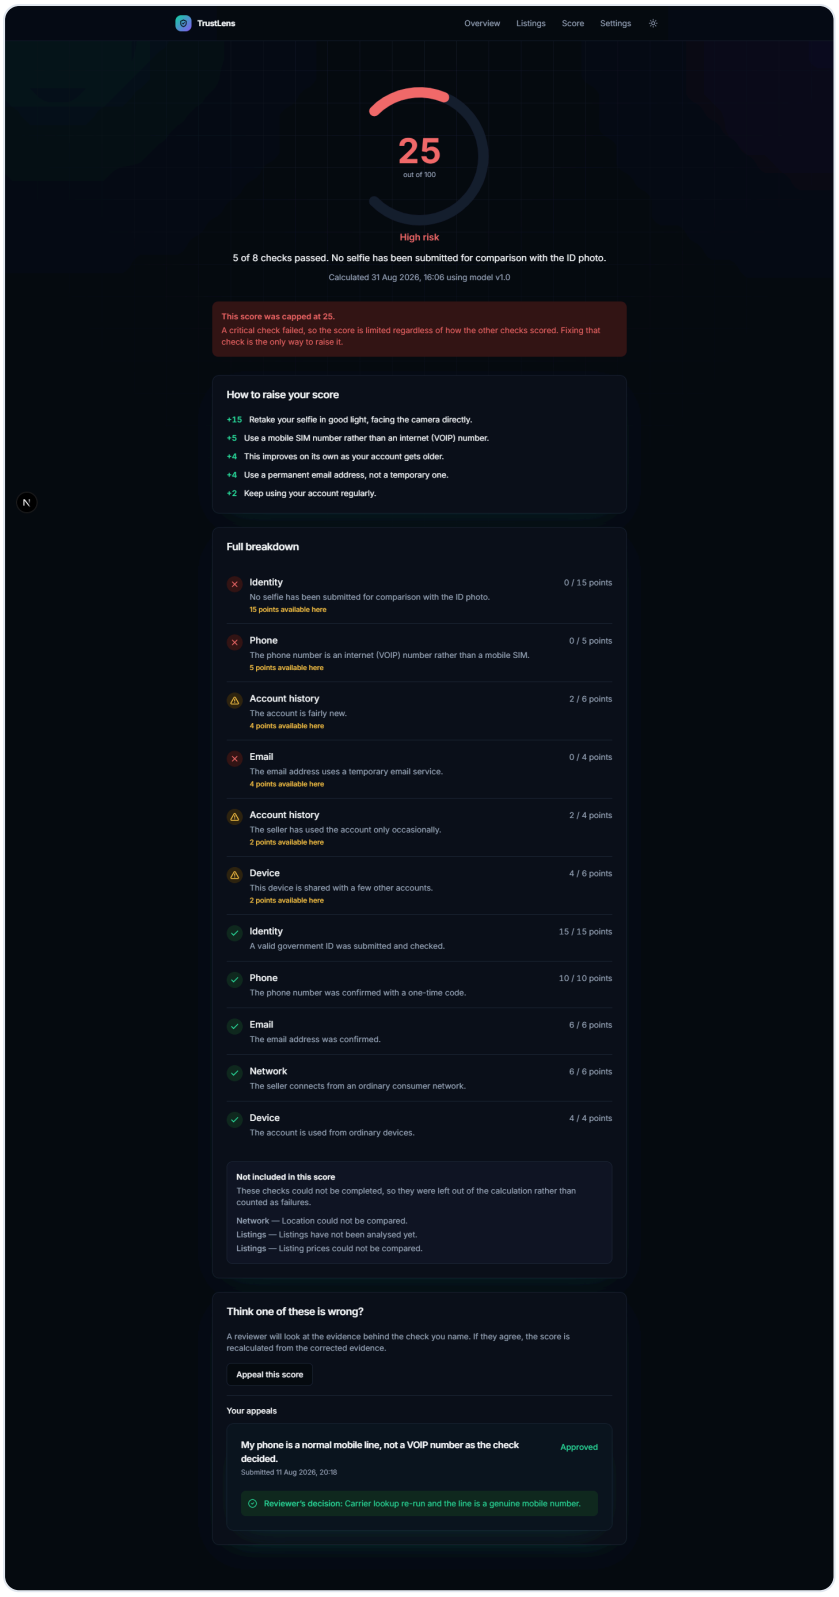

The four-check verification checklist (identity, phone, email, device), each showing the points it's worth.

The Trust Score, across all three risk bands

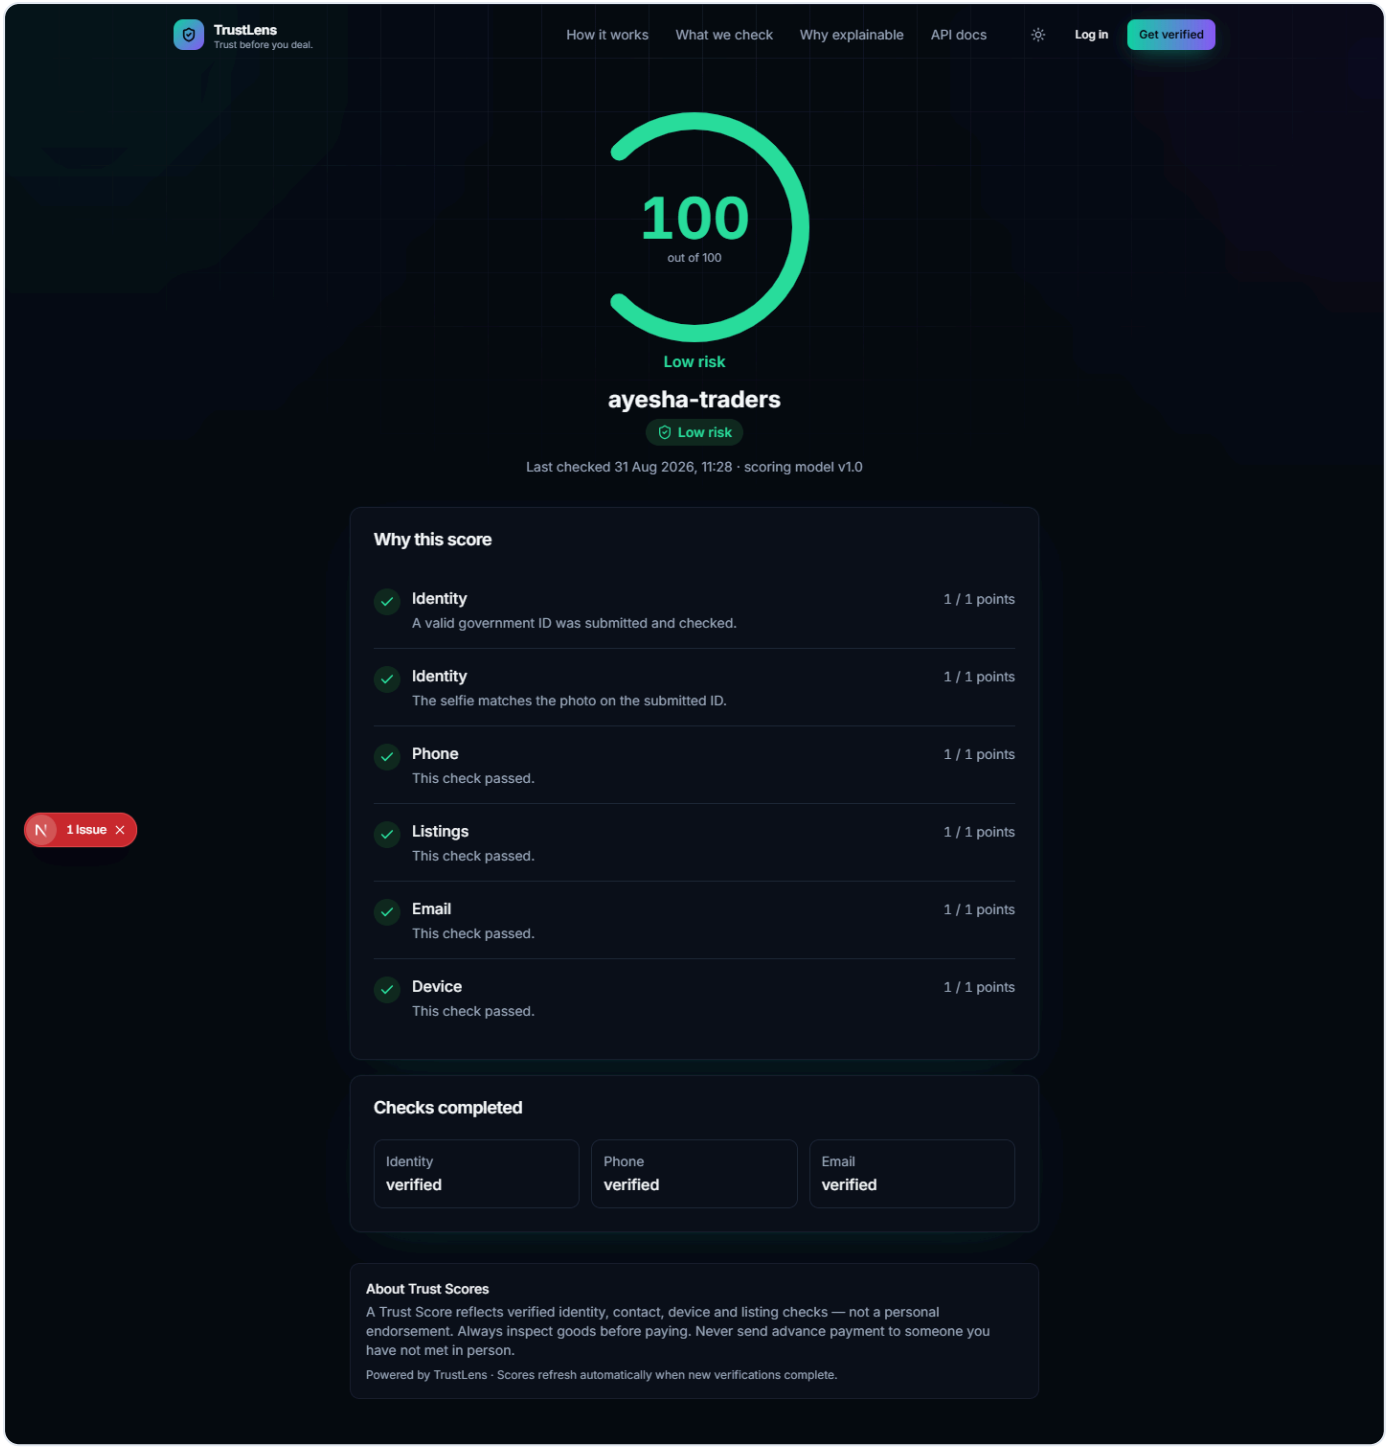

TrustLens
Overview
Listings
Score
Settings
77
out of 100
Medium risk
8 of 10 checks passed. The seller connects through a VPN, hiding their location.
Calculated 31 Aug 2026, 16:28 using model v1.0
How to raise your score
+6 Connect without a VPN or proxy so your location can be confirmed.
+5 Use a mobile SIM number rather than an internet (VOIP) number.
+5 Avoid urgency pressure and requests to move off-platform in listings.
+3 Sign in from your own device; this one is linked to several accounts.
+3 This improves on its own as your account gets older.
Full breakdown
Network 0 / 6 points
The seller connects through a VPN, hiding their location.
6 points available here
Listings 5 / 10 points
This check passed only partly.
5 points available here
Phone 0 / 5 points
The phone number is an internet (VOIP) number rather than a mobile SIM.
5 points available here
Device 3 / 6 points
This check passed only partly.
3 points available here
Account history 3 / 6 points
This check passed only partly.
3 points available here
Identity 15 / 15 points
A valid government ID was submitted and checked.
Identity 15 / 15 points
The selfie matches the photo on the submitted ID.
Phone 10 / 10 points
This check passed.
Email 8 / 8 points
This check passed.
Listings 5 / 5 points
This check passed.
Email 4 / 4 points
This check passed.
Device 4 / 4 points
This check passed.
Account history 4 / 4 points
This check passed.
Not included in this score
These checks could not be completed, so they were left out of the calculation rather than counted as failures.
Network — This check could not be completed.
Think one of these is wrong?
A reviewer will look at the evidence behind the check you name. If they agree, the score is recalculated from the corrected evidence.
Appeal this score
Your appeals
The selfie I uploaded clearly matches the photo on my CNIC document. Approved
Submitted 11 Aug 2026, 20:28
Reviewer's decision: Carrier lookup re-run and the line is a genuine mobile number.
My phone number is a normal mobile line, not a VOIP number as detected. Approved
Submitted 11 Aug 2026, 20:00
Reviewer's decision: Carrier lookup re-run; the line is a genuine mobile number.

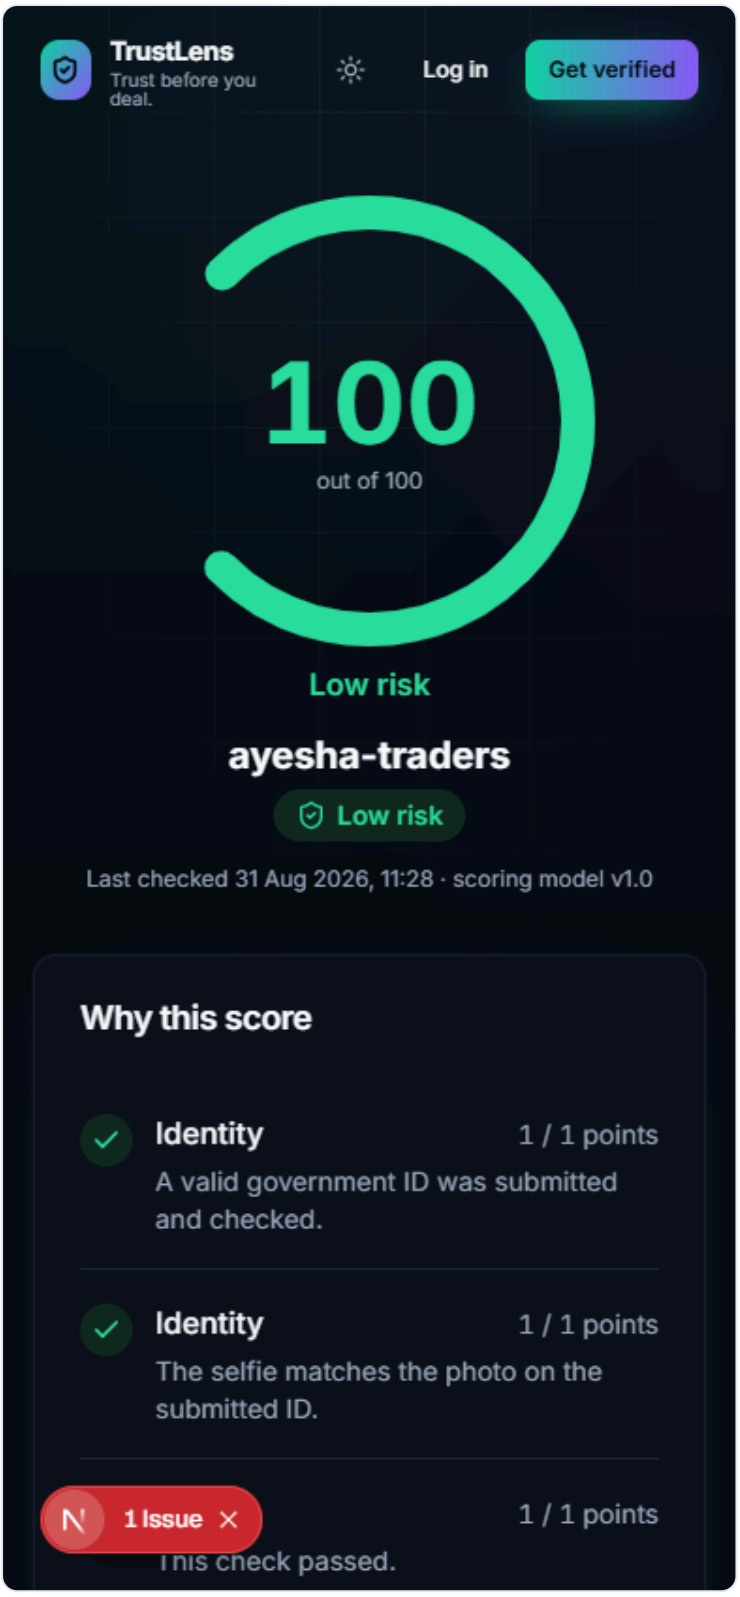

The same page rendering three genuinely different sellers from the demo seed data — a fully-verified seller (LOW), a partially-verified one (MEDIUM), and one with a failed critical check and a visibly capped score (HIGH). Note the appeals section at the bottom of this same page in the high-risk capture — appeals are not a separate screen in the current build.

The buyer's view

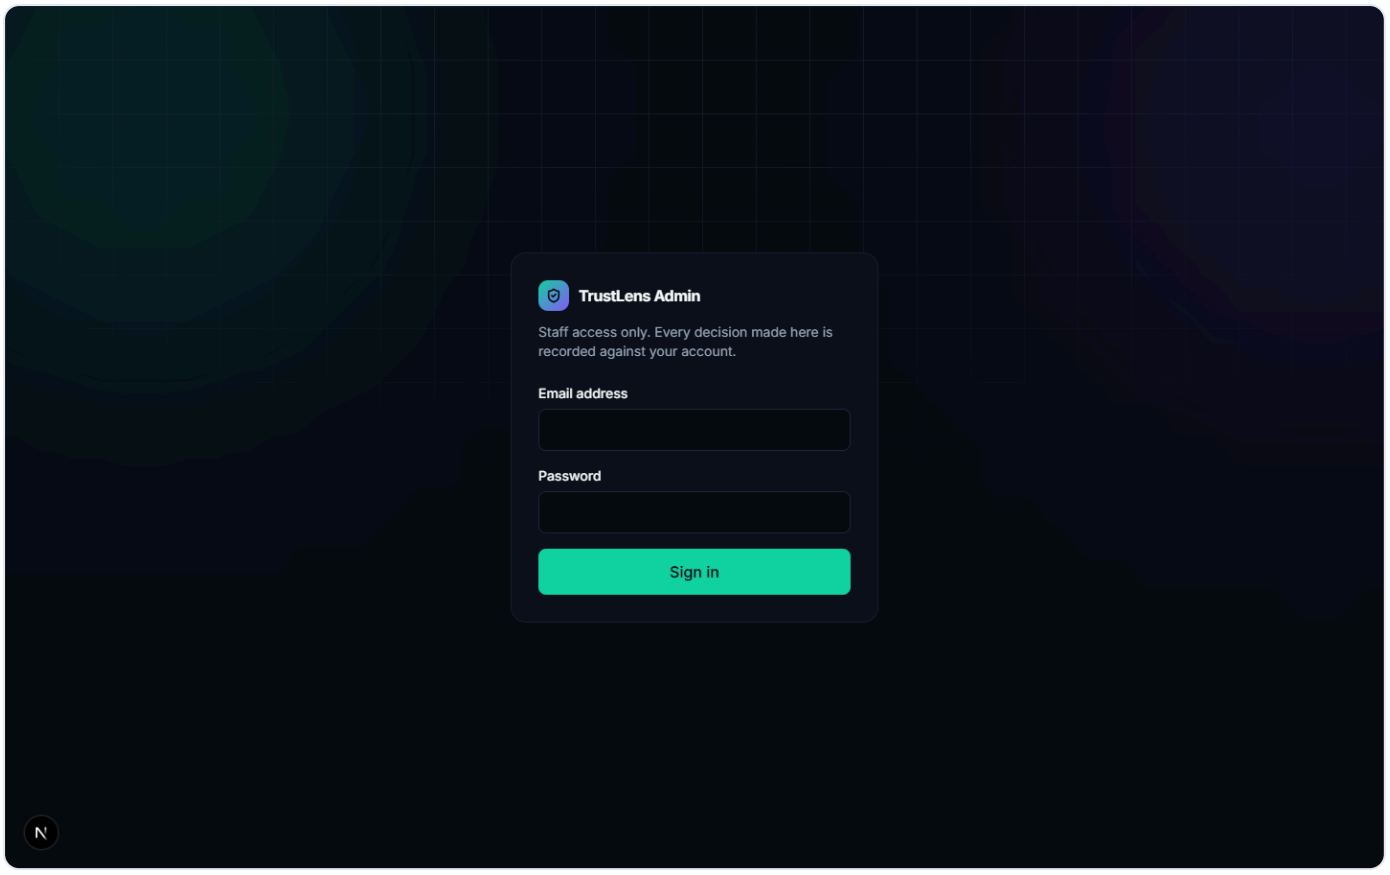

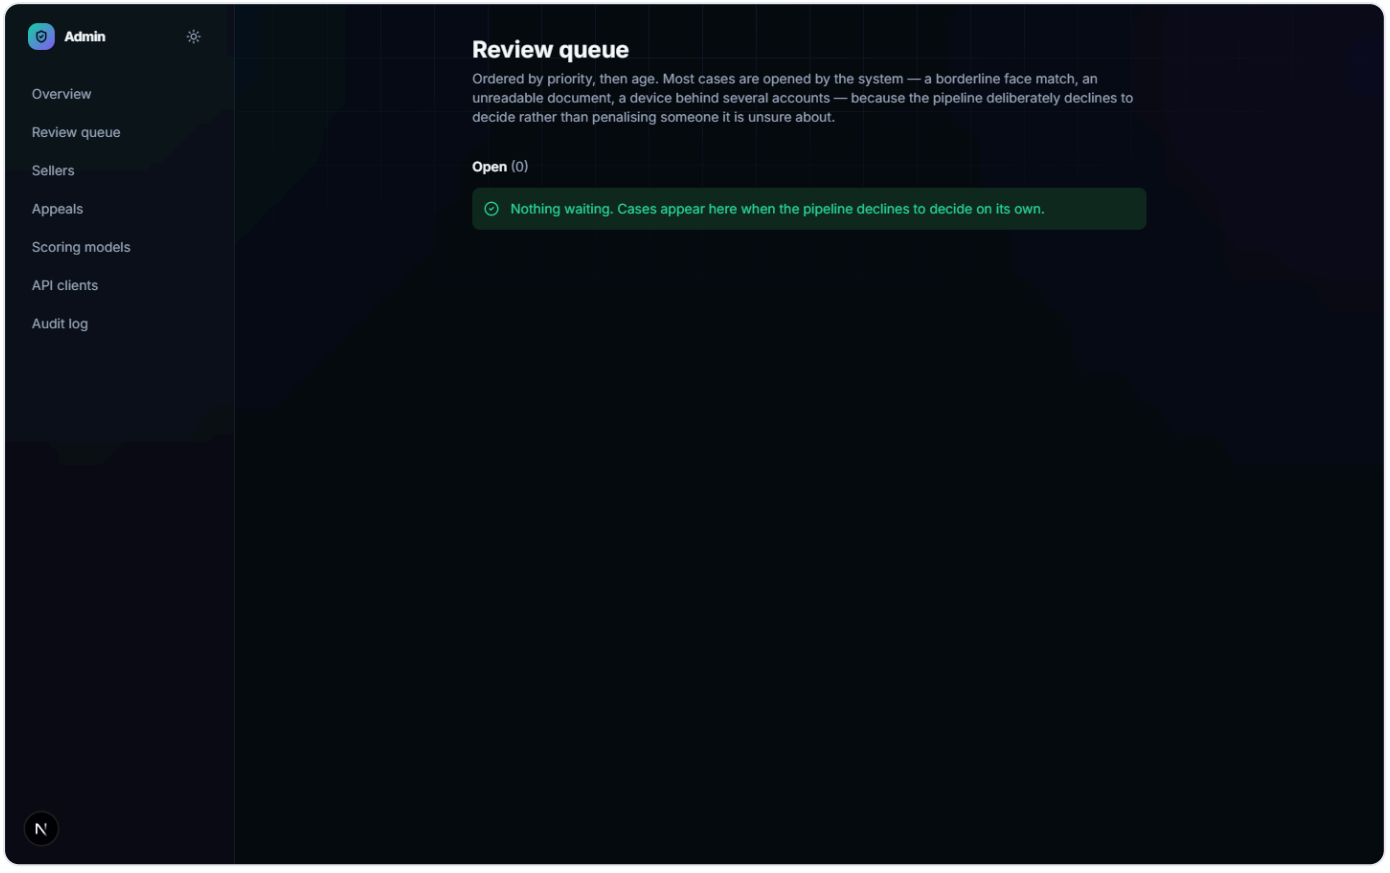

The anonymous, no-account-required public score page — the screen a buyer actually sees, and the one the entire product exists to produce.

The same page at a 390px mobile viewport width — this is the screen shown in the live demo, and it must remain legible at this size.

Staff / admin

Staff sign-in and the identity/appeal review queue — the part of the admin panel that is complete and working end-to-end. See `05-Test-Cases.md` §6 (DEF-09) for what's still unbuilt in the rest of the admin

panel.

If any image above renders as a broken link: these are real captures taken from a running local instance during this documentation pass, not generated mockups. If one is missing, check `06-User-Manual.md`'s own notes for that screen — a small number of screens may be noted there as not independently captured (e.g. because a route turned out not to exist separately from another page already shown).

4. Reading order

If you are...	Read in this order
An evaluator / supervisor	`00-Handover.md` → `01-Simple-Guide.md` → `07-Thesis.md` → dip into `03` / `04` / `05` for detail as questions come up
An incoming developer taking over the codebase	`01-Simple-Guide.md` → `04-SDD.md` → `03-SRS.md` → the engineering docs in `docs/` (architecture, folder structure, dev setup) in the repo root, which this package summarises but does not replace
An end user of the finished product	`06-User-Manual.md` only

5. Viewing diagrams

Every diagram in this package is written as Mermaid code (` ```mermaid ` fences) directly inside the Markdown source. They will **not** render as pictures in a plain-text editor or an unconfigured preview:

- **GitHub** renders Mermaid natively in any `.md` file.
- **VS Code** renders it with the "Markdown Preview Mermaid Support" extension installed.
- **The HTML build** (`pdf/` and the `.html` set) has every diagram pre-rendered to inline SVG — this is the reliable fallback if your viewer doesn't support Mermaid.
- **The Word thesis** uses the pre-rendered PNGs in `diagrams/`, since Word cannot render Mermaid at all.

Every diagram in this package was render-tested against real `mermaid.js` before being shipped — see the QA note at the bottom of `00-Handover.md`'s revision history if you need to re-validate after an edit.

6. Rebuilding the documents

```
python build_html.py --docs-dir fyp-submission/docs --project-name "TrustLens"
python render_diagrams_png.py --docs-dir fyp-submission/docs
node build_thesis_docx.js --src fyp-submission/docs/07-Thesis.md --out fyp-submission/docs/
python build_pdf.py --docs-dir fyp-submission/docs --footer "TrustLens FYP -- Minhaj Univer
python make_package.py --docs-dir fyp-submission/docs --project-slug TrustLens
```

Run in this exact order — each step depends on the one before it. Full script options: pass `--help` to any of them.

7. Live status

Document	Status
00 – Handover	Complete
01 – Simple Guide	Complete
02 – Index	Complete
03 – SRS	Complete
04 – SDD	Complete
05 – Test Cases	Complete — **26 of 51 specified test cases executed (~51%)**, honestly marked; see its banner
06 – User Manual	Complete
07 – Thesis	Complete — front matter, 8 chapters, references, 4 appendices
Screenshots	Captured from a real running local instance
Diagrams	All render-tested against `mermaid.js` before shipping
Word thesis (`.docx`)	Generated — **update its Table of Contents field in Word before submitting**

Open items before final submission (from `REMAINING.md` in the project root, Track D): collecting real CNIC/face test images for accuracy validation, completing the admin panel, implementing MFA, and rehearsing the viva. None of these block this documentation package from being complete and honest as of today — they are the project's own next steps, not gaps in what's described here.
